Pydraul 250A(?)

Dear Cas:

Confirming recent discussions, enclosed are copies of the acute toxicity reports for our fire resistant fluids Pydraul 312A and MCS 1083. These fluids are quite similar to our other Pydrauls which your company has used successfully for many years. Changes in composition during the last year became necessary in order for us to eliminate the use of polychlorinated biphenyls in systems where escape to the environment could not be controlled completely.

I am told that Pydraul 312A is currently being used in the Bay City, Holland, and Grey Iron foundry at Saginaw. It is also in service in ten other General Motors plants.

One of our representatives will be delivering a sample of MCS 1083 to your Tonawanda plant shortly so you may be receiving a request for comments concerning the safe handling and use of this fluid from Tonawanda.

Best personal regards,

Sincerely,

Elmer P. Wheeler
