There's no need for you to settle for anything less than a transformer that will handle the full basic impulse level of your electrical system. Your answer to the overload and power surge problem is an askarel fire-resistant transformer.

In addition to this benefit, askarel transformers present fewer installation and start-up problems. They simplify system design, require less maintenance, are quieter and fire-resistant. Moreover, askarel transformers operate much cheaper than open dry types due to lower coil and core losses. This allows you to give the building operator an added savings for years to come...as much as $600 per year on average size units.
