UNIROYAL TO DISCONTINUE USE OF ASBESTOS FIBER

A decision has been made to discontinue the use of asbestos fiber at UNIROYAL Hogansville Plants prior to July 1st, it was announced by David Crawford, Plant Manager. Federal regulations require that manufacturing operations be conducted to minimize the amounts of asbestos particles that disperse into the air. The plant has been operating to meet these requirements, but more stringent requirements are scheduled to become effective July 1st.

Mr. Crawford stated that asbestos fiber has been combined with synthetics and cotton fibers and used in high temperature-resistant fabric and yarns for the past 30 years at the Hogansville Plants.

Substitutes for the asbestos fiber have been undergoing development and this work will continue. He stated the substitute high temperature fibers included Nomex, glass and also steel cord.

The Hogansville Plants employ approximately 500 people and approximately 110 are engaged in manufacture of products which use asbestos.

To the extent that jobs are affected on present equipment now manufacturing yarns and fabrics containing some asbestos fibers, employees will be offered jobs in other departments of the Hogansville Plants.
