What is Sr 902?

VISIT TO: TREMCO MANUFACTURING
Cleveland, Ohio

DATE OF CALL: September 17, 1968

FOR TREMCO: Bill Golla - Research Chemist

FOR MONSANTO: Lou Gallipeau
Ken Wells

Although Tremco is an Ohio Solvents account, I requested we call on them to discuss their polysulfide sealant applications and, in particular, ~~their fogging~~ problem with Aroclor 1254. Tremco had previously been contacted by Thiokol concerning the use of Santicizer 278 in applications which must meet rigid fogging requirements. Bill had finished most of the evaluations on the product and concurred that Santicizer 278 was an excellent product for his applications and will use Santicizer 278 in the near future. Bill's only reservation was the cost of Santicizer 278, and asked if we might have a plasticizer with better fogging characteristics than Aroclor 1254 but not as good as Santicizer 278. This would be for other applications which would not have to pass the rigid requirements of the "Twindow" type sealants. I recommended Santicizer 902, and they will evaluate.

Bill also mentioned they needed plasticizers to give better low temperature flexibility to their butyl sealants and I suggested DNODA or DIDA. He will order these samples thru Ohio Solvents.

Action Required:

(KW) - Send sample of Santicizer 902 to Golla.
