I attach an article from the "New Scientist" of 15 December, 1966. The New Scientist is an English periodical given over to "Popular" Science. On its inception about sixteen years ago, I thought it was given over more to sensation than to a strict regard for scientific accuracy. I am sorry to see that it has not changed over the years.

Their article on "PCB" is the most opinionated we have seen so far on [redacted] Society, and I am sure their omission of the word Monsanto has prevented even greater repercussions. Their theory on how PCB finds its way into fish "and later humans" is an all-embracing one. I only hope Rachel Carson never subscribed to the New Scientist and that Ralph Nader doesn't decide to!
