We have surveyed the Texas City Industrial Chemicals operations for points of contact with PCB's as requested in the reference memo. Use as electrical transformer fluid was the only point of potential contact revealed by the survey. This use is controlled by the plant electrical group and elimination of this use is not planned. Our planned actions are limited to reviewing potential product contamination if an unusual release of PCB's such as a transformer "blow-up" occurs.

A copy of a recent PCB survey of the Texas City plant (ERH to RDS, 8/24/71) is attached for your information.
