SUBJECT tertiary-Butylamine

REFERENCE

TO : Mr. John Fox
TEXAS CITY

This refers to our conversation concerning the toxicology of tertiary-butylamine. This, as you know, is a fairly severe toxic agent. This is from the standpoint of oral intake. It is extremely toxic from the standpoint of inhalation in concentrated form and is only mildly toxic from the standpoint of the skin. It is, however, corrosive on the skin and corrosive on the eye.

Pathological investigation of the animals after taking the material orally showed effects on the lungs, liver, and intestinal tract. The same type of pathology was noted following skin application. The kidneys in these acute experiments were not remarkable.

After analyzing the cases of the men you showed me, together with the acute findings in our experiments, I do not believe that we are allowing any exposure to exist that would give the men any trouble. The material is so irritating that I doubt if anyone would get a toxic dose provided he has free access to escape.

Please keep me posted on developments in this area.
