MEETING ANNOUNCEMENT

International Symposium on PCBs in the Great Lakes
March 15-17, 1982
Kellogg Center for Continuing Education
East Lansing, Michigan

Continuing presence of polychlorinated biphenyls in the Great Lakes raises serious questions about possible risks to environmental quality and human health. The purpose of this symposium is to present and evaluate data about PCBs which influence regulations designed to protect human health. Because of their stability in the environment, PCBs accumulate in aquatic organisms and enter the human food chain as contaminants in fish. Therefore, emphasis will be placed on the relationship between Great Lakes fish consumption and human exposure and health. Interested parties from State, Provincial and Federal agencies, academia and industry are invited to attend and participate. Special invitation is extended to individuals concerned with environmental quality and recreation in the Great Lakes region. Space will be provided for poster presentations and small group discussions.
