The status of our plans for increasing Liquid Aroclor capacity via debottlenecking effort is as follows:

W. G. Krummrich

There are two projects at WGK that should be completed around September 1, that will result in an increase in Liquid Aroclor capacity of about 1.5 M lbs./yr. These projects involve an increase in the size of the transfer chlorine line and an increase in chlorine vaporization capacity. In addition, we are proceeding on verbal approval authority to install a still preheater that should result in 5-7 M lbs./yr. increase and a capital project cost of $6,500. Timing on this project is still a bit indefinite, but we hope to have it completed in order to meet our 1968 forecast of 33 M lbs. for WGK.

Anniston

The project for installation of larger pumps and instruments on the stills should be completed by October 1, with October 15 as a target date for demonstration of 53 M lbs./yr. capacity at Anniston.

If there is any significant change in these plans, I will advise you.
