Dear Don:

Enclosed are the documents we discussed on the telephone today. Specifically, I have included three copies of papers relating to Dr. Bruce Ames' discussions of the relative risks of anthropogenic compounds and natural chemicals. PCBs are mentioned in passing in each of these papers.

The second group of papers concern the demonstrations that polychlorinated dibenzo-p-dioxins do not result from incomplete combustion of PCBs, although polychlorinated dibenzofurans may be formed under certain limited conditions. Especially useful may be the Federal Register reference and the pages from the EPRI report on utility fluids. Note the highlighted statements in these documents.

I hope these are useful to you. If you have any questions, please contact Tom Bistline or myself.

Sincerely yours,

Robert G. Kaley, II
