PCB's

Attached is a pre-publication copy of an article reporting the results of PCE's on pheasant reproduction, etc. I think we can assume that there will be more and more of these appearing based on the samples we have provided various institutions in the last two years.

The data show that at sufficient dosages, Aroclor 1254 does have an effect on ring neck pheasant reproduction behavior and survival of chicks. Interestingly, there was no significant effect on eggshell thickness.
