RE: PHOTOMICROGRAPHS OF ASBESTOS FIBERS IN FLAMEMASTIC FLAME RETARDANT

Enclosed are four photomicrographs taken of a slide prepared from the membrane filter worn by the painter spraying the flame retardant. As indicated on my December 27 report, the level of asbestos fiber concentration was well below the threshold limit value, nevertheless, some fibers were found as photos 2, 3 and 4 show. However, the majority of the filter is represented by photo 1. Reprints of these photomicrographs have been obtained so that Mr. Tom Bonney and Mr. Wayne Genter may have access to this information.
