October 1, 1991

Mr. Arthur Berkins
ARCO Fairbanks

Dear Mr. Berkins:

While you were on board the ARCO Sag River from July 15-21, 1991, Clayton Environmental Services, Inc., was taking samples to determine airborne levels of asbestos and conducting employee awareness training. During the training classes we indicated that the results of the survey would be provided to all crew members on board at the time. Recently the results of the independent lab analysis were received. The full report has been sent to the vessel and we will ask the Master to make the report available to all crew members. At the completion of the monitoring program, which involves riding the eight AMI vessels which are known to be constructed with some asbestos bearing materials, a summary report will be mailed to all vessels.

Airborne asbestos levels are measured by drawing a volume of air through a filter and counting the number of fibers that are retained in the filter. All air samples collected on the Sag River showed concentrations below the applicable permissible exposure limits (PELs) established by the U.S. Coast Guard of 0.1 fibers/cubic centimeters (f/cc) and the U.S. Occupational Safety and Health Administration (OSHA) PEL of 0.2 f/cc. These samples were also below the Environmental Protection Agency (EPA) recommended concentration of 0.01 f/cc for general occupancy.

On board the Arco Sag River 33 samples were taken and analyzed to determine the presence of asbestos fibers. Samples were taken from both working and living spaces. Samples analyzed by an independent lab ranged from "none detected" to .008 f/cc.

The complete report is on board the Arco Sag River and available for your review. If you would like any additional information, please feel free to call me at (213) 590-4521.

Sincerely,

Jay C. Kitchener
Manager, Safety, Health &
Environmental Protection

All air samples collected on the Sag River showed concentrations below the applicable permissible exposure limits (PELs) established by the U.S. Coast Guard of 0.1 fibers/cubic centimeters (f/cc) and the U.S. Occupational Safety and Health Administration (OSHA) PEL of 0.2 f/cc. These samples were also below the Environmental Protection Agency (EPA) recommended concentration of 0.01 f/cc for general occupancy.

On board the Arco Sag River 33 samples were taken and analyzed to determine the presence of asbestos fibers. Samples were taken from both working and living spaces. Samples analyzed by an independent lab ranged from "none detected" to .008 f/cc.

The complete report is on board the Arco Sag River and available for your review. If you would like any additional information, please feel free to call me at (213) 590-4521.

Sincerely,

October 1, 1991

Mr. Sanford Cohen
107 Frog Hollow Road
Ellington, CT 06029

Dear Mr. Cohen: Sandy

While you were on board the ARCO Sag River from July 15-21, 1991, Clayton Environmental Services, Inc., was taking samples to determine airborne levels of asbestos and conducting employee awareness training. During the training classes we indicated that the results of the survey would be provided to all crew members on board at the time. Recently the results of the independent lab analysis were received. The full report has been sent to the vessel and we will ask the Master to make the report available to all crew members. At the completion of the monitoring program, which involves riding the eight AMI vessels which are known to be constructed with some asbestos bearing materials, a summary report will be mailed to all vessels.

Airborne asbestos levels are measured by drawing a volume of air through a filter and counting the number of fibers that are retained in the filter. All air samples collected on the Sag River showed concentrations below the applicable permissible exposure limits (PELs) established by the U.S. Coast Guard of 0.1 fibers/cubic centimeters (f/cc) and the U.S. Occupational Safety and Health Administration (OSHA) PEL of 0.2 f/cc. These samples were also below the Environmental Protection Agency (EPA) recommended concentration of 0.01 f/cc for general occupancy.

On board the Arco Sag River 33 samples were taken and analyzed to determine the presence of asbestos fibers. Samples were taken from both working and living spaces. Samples analyzed by an independent lab ranged from "none detected" to .008 f/cc.

The complete report is on board the Arco Sag River and available for your review. If you would like any additional information, please feel free to call me at (213) 590-4521.
