See appendix 1 for a draft of the data collection form. This form is to be completed on each case and control at the time they enter the study. A second form must still be developed to record follow-up information on an annual basis.

3. Employment history

- Date hired
- Payclass when first hired
- Payclass when entered into study
- Pension date
- Job titles and employment dates for all Du Pont jobs, with a special note for those having a significant potential exposure to asbestos (e.g., mechanics, craftsmen)
- Work history prior to Du Pont, with a special note if it contains jobs having significant potential exposure to asbestos.

E. Sources of data on cases and controls

As mentioned above, cases will be identified through the company's asbestos screening program, and controls will be selected from the plants' yearly payroll rosters.

These subjects' demographic and medical data will be collected from employee medical records. Plant physicians will complete the initial medical forms for cases and controls.

Data collection forms for work histories will be completed by other plant personnel. Work histories will be abstracted from plant records.

Every year the computer will generate lists of study employees for whom follow-up information (eg., pulmonary function measurements, X-ray findings, current smoking habits) is needed. These lists, along with data collection forms, will be sent to plants to be completed by medical personnel.

All data collection forms will be forwarded to Corporate Medical Division for processing.

F. Computer storage of the data

The ARPA cases, controls, and associated data will be stored on the Nemours IBM computer.
