White Leghorn Chicken Study with
Aroclor 1242 at 2, 4 & 8/ppm

W. B. Papageorge
B2SK

Attached is a copy of the report from Bio-Test on the extension of the original chicken work with Aroclor 1242. The results were summarized briefly in the status report I have provided you earlier for John Durland and in our portion of the PCB Status Report for June.

A copy of the report is being forwarded to Scott Tucker. I have reminded him on the telephone that he should be on the alert for tissue samples from this additional study. You will recall that Kep and Otis believe that tissue, eggs, etc. had already been sent to Scott with those from the original studies.
