VISTA

During the period of August 7, 1986 to August 21, 1986, a series of test well samples were analyzed for volatile organics using Method 624. These consisted of 1 trip blank, 5 field blanks and 21 samples. The results of these analyses are attached. Each sample was spiked with three surrogate standards at the 20 ppb level. The average percent recovery is shown on Table I. The test well locations you provided (taken from the Geraghty & Miller, Inc. Report - Phase II Ground-water Quality Assessment) are shown in Figure I.
