intracompany memo

to Mr. H. W. Scharf — location Milford

from G. W. Green — location Tigard

subject AIRBORNE ASBESTOS SURVEY OF MILFORD, VIRGINIA JOINT CEMENT PLANT — date March 29, 1976

cc: Mr. J. R. Hurd - Portland
Mr. H. W. Peele - Wilmington
Mr. G. F. Fowler - Marietta

On November 25, 1975, the Milford joint cement plant was monitored for asbestos dust by George Fowler. The filter cassettes were then sent to Tigard for counting. All the individual samples, thus all the time weighted averages, were below the 5.0 fibers/ml maximum currently in effect.

Five representative workers were sampled during an entire work shift and, in addition, area samples were taken at various locations throughout the plant. As at all the joint cement plants surveyed, the dry mixer man recorded the highest time weighted average and the highest individual count. This is the only position which is over the 2.0 fibers/ml maximum which will be in effect in July, 1976.

A summary of the data as well as individual records and count worksheets are attached.
