SOUTHERN ASBESTOS

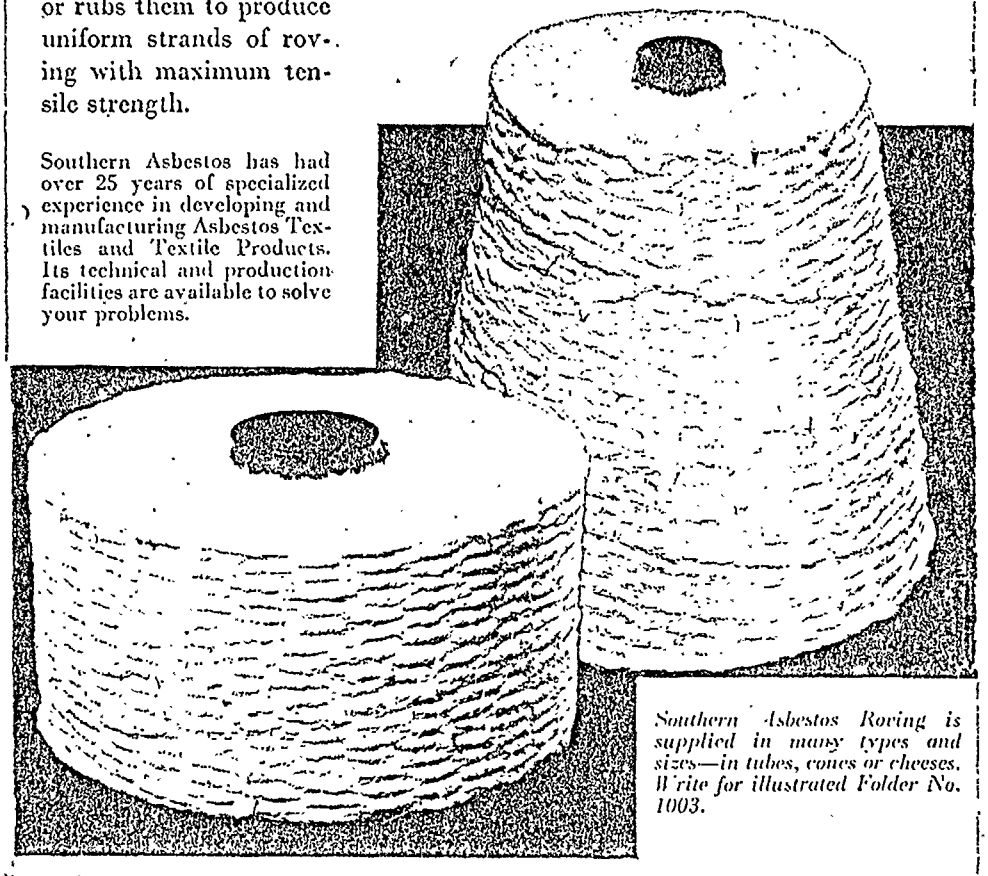
ROVING

Southern Asbestos Roving—a single cord of untwisted asbestos fibre—is widely used to flame-proof many types of electrical wires and cables. Carefully selecting the proper fibres, Southern cards them and condenses or rubs them to produce uniform strands of roving with maximum tensile strength.

Southern Asbestos has had over 25 years of specialized experience in developing and manufacturing Asbestos Textiles and Textile Products. Its technical and production facilities are available to solve your problems.



Southern Asbestos Roving is supplied in many types and sizes—in tubes, cones or cheeses. Write for illustrated Folder No. 1003.

search today, in every branch of productive work, has reached out beyond the precincts of the laboratory because it is now so closely related to technological advance in practice. Electronics and mechanical progress which, in turn, is identified with man in his work is the direct result of creative engineering. Similarly, in most operative techniques, with the tools found in every sphere today, research work leads on to increased economic productivity.

It may be said that in every field, research means simply a careful search or enquiry after or for something and, although we may not find the thing we are seeking, we are not likely to find anything unless we persist in the search.

In every mine, mill or factory there should be an organized and continuous quest for improvement in working methods and machines to attain better results. Apart from the stimulation of competition in the productive world, research work, by revealing the smallest details, at least tends to reduce working costs by reevaluating current methods and processes. More impressive results often assist materially in improving mechanical efficiency of standard machines and equipment. The beneficial results of such research suggestions may not appear overnight, since this class of work is uncommitted and no immediate findings can be expected, but it is certain that the whole economy of any undertaking is bound to benefit from critical investigation and creative research.

THERMOID/LAGGING CLOTH—A major development for asbestos insulating wrap has been placed on the market by the *Thermoid Division, H. K. Porter Company, Inc.* Designated Custom Lag Rewettable Lagging, *RWL-100*, the new product is an asbestos lagging material which has a built-in adhesive that impregnates the asbestos cloth throughout. Adhesive materials utilized in the lagging are completely inorganic, water dispersible, and also possess positive affinity to asbestos cloth. The rewettable lagging was developed at the Charlotte, North Carolina, asbestos textiles plant of the Thermoid Division, where all raw material for the adhesive is formulated and mixed.

horse and North Vancouver, $589,080 was spent on buildings and equipment.

At the Cassiar Mine, 741,651 tons of ore were mined, and after treatment at the rock rejection plant, 482,583 tons of concentrate and 106,074 tons of untreated ore were delivered to the mill. The mill treated 576,040 tons of ore and concentrate and produced 75,742 tons of fiber. Some additional equipment was installed to improve the recovery of the spinning grades. There was a marked reduction in the turnover of labor and it is felt that the company's training program, in addition to improving work standards, played a significant part in this reduction.

A great deal of operating time was lost at the Clinton Mine during the first half of 1968 due to start-up problems, many of which were associated with the extremely cold temperatures. During the last six months, the plant operated very efficiently and costs approximated those budgeted. In 1968, 1,050,633 tons of ore were mined and 709,003 tons of concentrated mill feed were produced. The mill treated 711,067 tons of concentrate and produced 64,279 tons of fiber. Additional equipment will be added to the mill to improve recovery and quality control. Some experimental work is being done to determine the feasibility of producing a limited quantity of spinning fiber.

The mechanized handling of one ton units at the Asbestos Wharf, introduced in 1967, made it possible to warehouse and ship much higher tonnages through the same facilities. Experiments are being conducted jointly with shipping companies and customers in various parts of the world to further improve the methods of handling fiber shipments.

Detailed exploration was carried out in selected areas of Northern British Columbia and the Yukon Territory but no showings of economic interest were found. This is a long term exploration program and will be continued on a somewhat expanded scale in 1969.

ASBESTOS CORPORATION LIMITED

Net income for the year 1968 was $4,873,741 compared with the 1967 figure of $4,120,156. Net earnings applicable to the common shares came to $4,626,241 or $1.79 per share on the 2,582,850 common shares outstanding. This compares with $3,872,659 or $1.50 per share on the shares outstanding at the end of 1967.

At $43,631,836, sales were at an all time high and 11.2% ahead of last year. The Continental European market, one of the most important for the company, was well ahead of 1967. Sales to the United States, Latin America and Japan also improved over the previous year.

Although all mines operated at close to capacity throughout the year, overall production of asbestos fiber was off some 5% from 1967. This was almost entirely attributable to a decline in the yield from ore milled. The situation is expected to improve as the present yield is below the average recovery from known ore reserves.

In order to improve productivity and lower the cost of open pit mining operations, 23 new 45-ton capacity diesel trucks were purchased and put into operation.

During the year, a long term major program for the improvement

PORTER GIVES YOU BETTER PRODUCTS BY DESIGN

The Mineral Industry of Argentina (15c)—Argentina, in 1967, contributed comparatively insignificant quantities of mineral commodities to world supplies and continued to depend heavily on imports to meet domestic requirements. As a part of its efforts to encourage domestic mineral production, the Government was involved in several mapping and mineral exploration programs. Production of asbestos in 1967 reached an estimated 182 metric tons, compared to 57 the previous year. The export tables for 1966 did not include asbestos but 13,826 metric tons of asbestos were imported.

Minerals in the World Economy (25¢)—The continued expansion of the world economy in 1967 again placed a greater demand for raw materials upon the world's mineral producing industries. The value of world crude mineral production in 1967 was estimated at roughly $80,000 million. The value added by the processing of these materials in mineral industry plants on a worldwide basis is difficult to assess but probably was of the order of $200,000 million or more. United Nations' production indices for various sectors of the mineral industry for the world and for major groups of countries are presented, including data on the European Communist countries. Chapters include data on production, trade, consumption, investment, transportation, prices, reserves and resources, and policies and programs affecting mineral production and trade. There is also a very complete statistical summary of world production and trading of major commodities, including some figures on asbestos.

The Ninth International Mineral Processing Congress will be held in Prague, Czechoslovakia, June 1-6, 1970. The purpose of the Ninth Congress is to gather up-to-date experience and information on mineral processing. The following topics have been scheduled: comminution, classification, physical methods of separation, gravity concentration and flotation, chemical methods of ore dressing, and dewatering and waste water treatment and the automation of these processes. For the first time, the Congress will hold a symposium on the agglomeration of fine-grained materials covering sintering, pelletizing, briquetting, etc. Membership fee is $40.00 for attending members and $30.00 for accompanying members. The membership fee for non-attending members has been fixed at $8.00. Applications for membership must be sent, by August 30, 1969, to The Executive Committee, Ninth International Mineral Processing Congress, Ustav pro vyzkum rud, Modranska 23, Praha 4, Czechoslovakia.

NOTES FROM 1968 ANNUAL REPORTS

BBA GROUP LIMITED

Net profit of the Group attributable to BBA Group Limited, after deduction of minority interest and taxation, amounted to £1,280,680 in 1968, compared to £1,342,458 in 1967. Group external sales increased by 16.9% to £24,825,812 (£13,262,296 in the United Kingdom and £11,563,516 overseas). Capital expenditures of the Group were high at £2,443,849, 46.5% of which were incurred by overseas companies. The main items contributing to these expenditures were the expansion of BBA's friction material units at Textar in West Germany and Mintex Limited in the United Kingdom, expansion of the glass fiber production capacity in the United Kingdom and South Africa, and the continued development of the West Auckland site in County Durham.

Production resources at Scandura Limited were fully extended during the year and demand for its products continued to increase, notably in export markets. An exceptionally heavy demand for asbestos textile products occurred about the same time as the completion of the transfer of the asbestos yarn production unit to West Auckland, thus creating added management problems.

The principal activities of BBA are the manufacture of glass fiber products, friction materials and industrial textiles including asbestos yarn, cloth, tape, jointings and packings, and beltings and webbings for transmission and conveying.

World-Wide Consulting Services for the ASBESTOS INDUSTRY

SNC

During the past thirty years, Surveyer, Nenniger & Chênevert Inc. has designed several major asbestos mills and carried out a number of feasibility studies for asbestos developments—thus becoming one of the few consulting firms in the world with extensive experience in this specialized field.

Asbestos projects undertaken by SNC are located in Canada, U.S.A., Australia and Europe.

CLEANGARD™

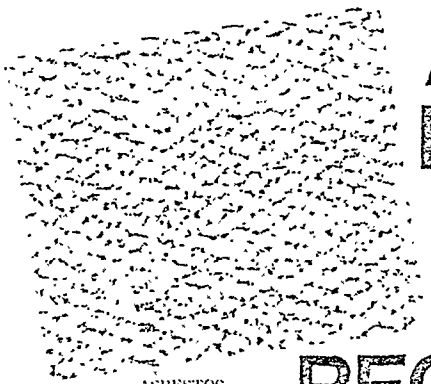
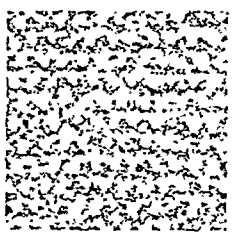
ASBESTOS PRODUCTS MEET OSHA REGULATIONS



ASBESTOS CLEANGARD CLOTH



CONVENTIONAL ASBESTOS CLOTH

Developed to meet the Occupational Safety and Health Act, Porter Cleangard process eliminates the need for labeling as a possible health hazard.

Cleangard total impregnation also increases abrasion resistance up to 50%. Asbestos products with Cleangard provide a safe, clean product for further fabrication in your plant, and are well within OSHA requirements for most of your end products.

Write for full information and a sample of asbestos cloth with Cleangard to Thermoid Division, H. K. Porter Company, Inc., Porter Building, Pittsburgh, Pa. 15219.

Thermoid . . . consistently dependable.
