REVIEW OF S&T SAFETY ENGINEERING STANDARD

I have reviewed the final version of the S&T Safety Engineering Standard. I agree with deletion of the "Sampling Record Form" and inclusion of a direction to contact Mashall Laboratory for sampling parameters and techniques. Addition of "7.3 Procedure. Mashall Laboratory Field Services Group shall . . . ." will enable faster contact with the correct people at Mashall. Inclusion of a recommended adaptor and supplier in 7.2.2 is necessary.

My general impression of the final version of S&T is very favorable, as it provides a thorough guide for asbestos measurement and control without oversimplification or the appearance of a "do-it-yourself" manual.

If I may be of further assistance for this or other industrial hygiene services, contact me.
