- Ohio State University (OSU) Dairy Cattle Research

  The OSU dairy cattle research project has begun Phase II which includes study of reproductive effects of PCB fed animals.

  The research protocol and grant have been reviewed and approved.

  Report #3 from Dr. Willett covering work in the second quarter of this year has been received. The results indicate that milk production was adequate for all animals and that high doses (1000 mg/day) of PCB did not have significant effects on milk productivity.
