1,1,1, TRICHLOROETHANE EXPOSURE STUDY

On May 19, 1978, a study of the operator exposure to 1,1,1, Trichloroethane was undertaken. An operator washed and cleaned a greasy piece of metal to determine the chloroethane concentration expected when performing a similar job. Four 15 minute tests were run and the results from the readings taken were well below the TLV of 350 ppm for 1,1,1, Trichloroethane.

Attached are the results of the study.
