Condensed Mat Spinning Process
44-436

Our present process of making condensed mats contemplates the use of a reciprocating drum to obtain the criss cross pattern rather than the reciprocating furnace of the Modigliani process.

This method involving lateral movement of a winding drum is disclosed in patent 1,738,217 of E. Wellech dated December 3, 1929 assigned to Owens-Corning Co. Presumably, this has expired and there is no question of infringement. A basic idea for the drawing of glass fibers from a continuous tank type furnace with non-electrical heating is disclosed in patent 1,796,571 by L. Mathieu.

We would appreciate your comments on the question of our present process being free of any infringement on Modigliani patents.
