Aroclor Control - December Report

Analytical Results

Results received during the month on Mississippi River sediment samples indicate that Aroclor is being lost from Sauget Village, and it is being concentrated in the River sediment.

The sampling program will be altered, in that the down stream samples will be collected further downstream of the present sampling point.

Control Program

1. A plan has been developed by TSD and production to identify and measure all possible sources of aroclor losses in dept. 246. Minutes of the above plan discussion will be forwarded when typed.

2. A memo will be distributed to all supervisors re-emphasizing the importance of total plant control of aroclor losses.

3. The overflow wier system in dept. 246 trench sewers is trapping aroclor. The quantity has not been determined due to problems in removing the viscous material from the trench.
