INTER-OFFICE CORRESPONDENCE

Industrial BIO-TEST Laboratories, Inc.

FROM: OEF

DATE: October 2, 1969

TO: DHJ

SUBJECT: Monsanto Aroclor Studies

J. 1800

At the time of my recent visit, the following points were agreed upon:

1. There will be no second hatch.

2. For those groups showing obvious effects from treatment, it is not necessary to prolong the study until 100 eggs have been collected for incubation.

3. You may proceed with partial sacrifice and recovery studies for the remaining animals for all groups showing no effects and for which 100 eggs have been incubated and with all groups showing effects regardless of the number of eggs which have been incubated.

4. Group composite egg samples are to be collected during the recovery period.

5. At sacrifice you are to collect group composite samples of liver, kidney, fat and muscle.

If there are any questions about these procedures, please call me.
