We certainly want to offer our thanks to you and the people at the Queeny Plant for the careful study which was made on the PYDRAUL A-200 odor question.

The plan to prevent high skin temperatures on the steam coil in the PYDRAUL A-200 tanks is certainly a good one.

We are not clear on the question of overheating PYDRAUL A-200 at Johnson Motors as they have no provision for heating the fluid in their storage tank. Their observations of odor were no doubt caused by smelling the material in a large vapor space in the tank which had been closed for some time.

However, if Johnson Motors or our other customers anticipate heated storage facilities, we will certainly advise them of the precautions mentioned in E. D. Malone's memo to you of March 30.

Richard Davis
