Dr. Jenkins

In accordance with our telephone conversation concerning the letter you received from Westinghouse Electric and Manufacturing Company regarding possibilities of shipping drums containing Aroclor with bungs down or in an inverted position. I have just received reply from Mr. Callahan indicating that handling in this manner would be directly contradictory to all established practices of loading. Also indicating that they have spent a number of years in educating transportation companies to the necessity of loading drums with bungs up and that this would be undermining all of the good that had been accomplished over this period of time. I am attaching copy of Mr. Callahan's memo which explains this in detail.

It appears that the answer to the question brought up by Westinghouse Electric and Manufacturing Company is "No".

What do you think about Mr. Callahan's suggestion of using cap seals over the bungs to eliminate any question of water contamination. If this could be worked out, it might solve the problem Westinghouse has been having of water contamination.
