Follow-Up Of Periodic Industrial Hygiene Survey December 1967

Your communication dated April 2, 1968, indicated that corrective action was planned to improved control of the dust created by brake lining mixing operations. We would appreciate additional information regarding the following two items:

1. Installation of ventilation control at the location where reclaimed asbestos is transferred and weighed. To date we have not received ventilation plans for our review as indicated in the April communication.

2. Is the industrial vacuum cleaner, cited in your communication, used to perform clean up in the Brake Lining Department mixing area?

D. L. Eschelbach, Chief
Industrial Hygiene Department
