Phone Conversations with Dr. Hunt

Dr. Hunt called twice today regarding the reproduction study on Aroclor (P7297). He could not interpret his notes from his visit on 4/28/70. I told him the same as before; (1) that in the 100 ppm level of 1242, there were only three females that became pregnant, and of those three, only one has pups at this time. (2) We would remate all females in that group for a one-week period in an attempt to save some animals for the next generation (F2 parents). (3) As of right now, there are no problems with the other Aroclors. 1254 is far behind due to the extra litters of last generation and 1260 thus far is having no difficulties.
