Mr. Lloyd Krysti
Thompson-Hayward Chemical Company
P. O. Box 66433
Baton Rouge, Louisiana 70806

Dear Mr. Krysti:

At the suggestion of Phil Kizer, please be advised that the following
is our matches for International Talc Company's Asbestine Talcs.

United Sierra's matches

Asbestine X

Fibrene C-400 or Beaverwhite 200
or Glacier 200

Asbestine 325

Fibrene C-500 or Beaverwhite 325

Asbestine 425

Mistron 139 or Mistron RCS

Rice Polishing Talc

Cascade 200

Mr. Krysti, please realize that it is difficult to offer exact matches
as the International Talc Company's Asbestine Talcs are mined in
New York State, whereas ours are mined in either Montana or California.
They are not exact replacement but are close enough so that they can be
co-coded and used interchangeably. My personal opinion is that from
a functional viewpoint our talcs are far purer and should work better,
providing your accounts take the time to test them. Also, attached you
will find our competitive matches on a general basis that we have listed
in our monthly publication "The Grind Sheet".

If there is any further technical assistance, please feel free to contact me.

Very truly yours,

UNITED SIERRA DIVISION

Gentlemen:

Re: Asbestos-Form Talc

Many of our customers are inquiring as to our talcs. They are interested in knowing if our talcs are true talcs and are not contaminated with tremolite, a form of asbestos. Attached is a form letter outlining our position and how such inquiries should be handled.

There are two separate types of inquiries received; one from the Occupational Safety And Health Administration (OSHA) pertaining to Federal Regulations, Volume 7, No. 110, which became law on July 7, 1972, and which concerns the allowable amounts of asbestos dust in the air of a manufacturing plant. The other inquiry is as a result of the Federal Drug Administration's proposed regulations regarding asbestos-form talc. Attached you will find copies of both the OSHA law and the FDA proposal.

Please be aware that under the proposal of the FDA, there aren't any test methods suggested for determining if talc contains asbestos-form. In addition, it is not stated what asbestos-form is. For example, a line of pulp fiber from a bag can, if looked at through a microscope, be classified as fibrous in nature in having just one particle present. Under the proposed regulations, the product would be classified as asbestos-form. We have written to the FDA suggesting that they identify asbestos-form mineralogically as the OSHA Regulation does, and also that they suggest a form of identification by X-Ray Diffraction techniques. We also suggested limits be stated, for example, 99% fiber-free.

Our form letter states what asbestos is; how we measure and what our experimental limitations are. X-Ray Diffraction techniques can detect tremolite at the 1% level. This is the limitation of the equipment and what we are saying is that our products are at least 99% fiber free. This is not to say that some of our products are not 100% fiber free but we know of no commercial method of determining this accurately and quickly.
