PYDRAUL 312 TOXICITY
SAFE HANDLING

D. R. Pogue
LOS ANGELES

We have a standard letter and toxicity sheet that we send out on Pydrauls and it always has seemed to work. At any rate, we rarely get further calls for information from the same person and presumably they are continuing to buy the material.

I am looking over your telegrams on the two cases you specified. In the case of Kaiser Aluminum, we were told "please send toxicological report on Pydraul 312 to Mr. Dave Fritz," so we sent him the standard reply. Really, if they needed information on first aid procedures we could have done that easily enough but it might be hard for us to judge the type of exposure they would have. In other words, if they were talking about exposure to Pydraul at elevated temperatures in a confined space, that is one thing, and if they were talking about Pydraul dripping from a machine in a large room, that is something else. If we get too elaborate, sometimes we are afraid we will scare the customer off.

I would say that all they need to do as far as first aid procedures is to remove the person from any exaggerated vapor hazard, wash the material off the skin with soap and water and irrigate the eyes with plain water.

It may be that we have expected the nurse or doctor or whoever receives our letters to be able to translate the information we give them into first aid procedures. They don't need any first aid supplies other than, as I said, soap and water and the eyes should be irrigated with plain tap water.

With regard to the McCulloch Corporation, we did overlook your request in the telegram to give medical treatment to the eyes. You can tell the nurse on your next call that our recommended treatment is as follows:

1) Wash out for five minutes with running water.

2) If any irritation persists, apply any anesthetic eye drops such as a 0.5% Pontocaine.

3) Apply cold compresses to the eyes until relieved.

This treatment is on more or less theoretical grounds because we have had no reports of any eye exposures to Pydraul. It is a fairly mild eye irritant and, presumably, washing with water is all that has been needed.

We will be glad to be more specific in the future to any of your requests.
