Q Now, did Dr. Merewether incorporate into this document the various methods that you told us about for dust suppression?

A Yes. He describes in this document the ways in which you can control dust, including ventilation, wet methods as we have talked about.

Q Okay. Now, could you tell us, you used the term a few moments ago sane appreciation of the risk.

What did you mean by that?

A Well, I actually said training and education. Basically, it is important for the worker to know the hazards they face and having to know why they have to use these controls to protect themselves.

It is also important that the workers know how to use the controls and how to use wet methods, how to use ventilation, how to isolate the process of containing the dust, so they have to be trained in how to do that.

Q You also said the use of respirators was a last line of defense?
