I. INTRODUCTION

Du Pont recognizes that there are many hazards inherent in industry; however, through sound and reasonable safety practices, time-losing injuries can be prevented. There is no doubt that working safely has great humanitarian value and enhances employee morale. Furthermore, accident-free work will prove to be more profitable for the Contractor, as it has for Du Pont. We therefore urge you to give particular attention to your employees' welfare in the workplace.

This handbook sets forth guidelines and rules for your operations at the Experimental Station. Each job, regardless of the type of work involved, presents problems that require special alertness, awareness, and good judgment on your part and on the part of your employees, Subcontractors, and/or vendors. The rules and regulations set forth in this booklet should set the proper "safety climate" but cannot be taken as all inclusive. In addition, these rules and regulations may be altered from time to time, with notice to the Contractor, by the Contract Administrator. In all cases, the Contractor shall review the safety hazards present and establish additional practices as needed to minimize them. It is your obligation to work safely and to correct unsafe acts, practices, and/or conditions for the protection of your employees and others. Contractors are fully responsible for their Subcontractors in the same manner as for their employees.
