Due to sales requirements for Pydraul 90-E and 115-E, we will have to continue with the previous plans of starting up June 19 on NC Phosphate. We only need about a week's production of NC and we want to avoid unnecessary changeovers so we will have to begin N_2C production on June 26, also as previously planned.

It is likely that we will not have completed our technical program so that we can implement a low-cost operation which achieves low phenol content and a pass on the emulsion test.

Therefore, N_2C operations commencing on June 26 should be segregrated for C Series Pydrauls only and we should make this a run for minimum cost at rated capacity. Hopefully, within a week or two, we will have the technology in hand to modify our operations and produce N_2C that is satisfactory for all applications. However, no process modification requiring a substantial departure from rated capacity is to be adopted without my specific agreement.
