Mr. H. S. Kline
Director Industrial Hygiene
and Sanitary Engineer
Frigidaire
Dayton 1, Ohio

Dear friend Hugh:

It was a pleasure to receive your letter of November 20. I am back on the job and feeling fine.

Recently we visited a plant where teflon is drilled and machined. Employees in this plant cracked on the job and whenever they got the shakes they were sent away from the job for a couple of hours and then returned. In this plant they sold teflon products at 700°F and removed them from the oven without cooling. We, of course, made recommendations in connection with this plant but we cite this case to show the nature of the hazard. No occupational disease claims have been filed from this company. We feel that if a company follows the Industrial Hygiene Guide Series on teflon they should have no difficulty. We know of no injury to the central nervous system or the brain from teflon or its decomposition products. Enclosed is a copy of my talk on "Gas Titration" which I gave at the last Industrial Health Conference.

Please drop in and see us sometime. Note our new location as indicated on the letterhead.

Very truly yours,

DeWitt Huffman
Industrial Hygiene Engineer
