Capacitor fluids could represent a very good potential use for both our pre-build product and our new GPP. Diane Clay has discussed this with two producers: Aerovox in New Bedford, Mass. and Armel Dublier (owned by Exxon thru Allied Electric). Comments on these two companies and their needs are:

Aerovox - use 42M pounds per week of DOP. Will not mention their supplier(s) but stated BASF and USS DOP as too high in water content. They want a plasticizer with dielectric constant higher than DOP and a dissipation factor as low as possible.

Armel Dublier - have two suppliers of DOP; they use 70M pounds per month. They have requested the dielectric strength, the dielectric constant and dissipation factor at 25°C and 100°C, and insulation resistance.

Is this information, note the Dublier request, that we can obtain within the Division or do we need to go to Specialty Chemicals personnel? If the latter, who are our contacts?
