REDACTED REDACTED Dr. Sannes Cl #11974 5/6/74

A UNION CARBIDE CHEST: Former radiographs are loaned. Left costophrenic inus partly off film. Cardiovascular silhouette not remarkable. Slight to oderate central calcific scarring and scattered small calcific scars more eripherally, right chest in lateral subapical and in pectoral area minimally o slightly less lucent than left, slightly wide obliquely vertical calcific ine at right base extends partly below shadow of diaphragm dome, similar line een on left through shadow of cardiac apex, tented dense patch of pleural eaction or fibrous scar projected at right cardiophrenic sinus lies posteriorly ight infrahilar linear markings moderately prominent and peribronchial arkings bilaterally slightly accentuated. Left apex shows minimal fibrocal- ific scarring and right slight and there is only faint trace of pleural eaction laterally at right base today.

onclusion: Former comparison films are loaned. Calcific scarring supposed ostly residual from old granulomatous disease but obliquely vertical basal alcific lines and right cardiophrenic sinus plaque and reticulated right nfrahilar markings and slight ground glass appearance of part of right chest re suggestive of asbestosis.
