## *Keeping X-Rays within bounds*

LEAKAGE of X-rays to adjacent rooms, thus endangering the occupants, can be prevented by coating the walls, ceiling and floor of the X-ray room with barium sulphate plaster. Such protection is not only positive but cheaper than any method heretofore employed.

Because of the complete protection which it affords and its relatively low cost, as well as its better appearance, barium sulphate plaster is being used in many doctors' offices as well as hospitals.

Further information, specifications and formula (patent applied for on process) may be had by writing:
