Hot Melts

For the record and as per our phone conversation, the two samples of hot melts appear to be plasticized with chlorinated terphenyls very much resembling Aroclor 5460.

The analyses were performed by Ed Emery's people, and involved mass spec - g.l.c. on the gross sample. An attempt by me to extract the plasticizer resulted in solution of both plasticizer and resin. The analysis mentioned above was performed on the residue left after the solution of resin and plasticizer was stripped of solvent.
