Leaded Zinc Pigment

Our present plans are to eliminate the usage of 68 22 00 and 68 29 00, leaded zinc oxides, by June 30, 1971.

You should reformulate those formulas under your control and use 67 35 60, Oxide 30P, plus extender to replace the leaded zinc oxide. Prime Alternate Formulas should be issued when a label analysis is not involved. This procedure will allow the factories to produce under either formula so that overstock of 12/68 can be eliminated.

It is requested that you advise us when the alternate formulas under your control have been issued.
