5:09 p.m.	The St. Louis based Monsanto Company says a preliminary study has found no cases of malignant melanoma or pancreatic cancer among current or former employees of the company plant that produces PCBs. Now PCBs are chemicals that have been termed a significant health hazard by the Environmental Protection Agency. The Monsanto study was prompted by a recent Mobil Oil Corporation study in which 3 cases of melanoma and 2 cases of pancreatic cancer were found among 72 employees who were exposed to a PCB product while working on a Mobil plant in New Jersey. The Monsanto study did find a higher than normal incidence of lung cancer among deceased employees who had worked at the PCB plant but officials say the study was only a preliminary one and there is no indication that the presence of the lung cancer was related to PCB.
6:09 p.m.	The St. Louis based Monsanto Company says a preliminary study has found no cases of malignant melanoma or pancreatic cancer among curretn or former employees of the company plant that produces PCBs. The Environmental Protection Agency has termed PCBs significant health hazards. The Monsanto study was prompted by a recent Mobil Oil Corporation study which found 3 cases of melanoma and 2 cases of pancreatic cancer among 72 employees exposed by PCB at a Mobil plant in New Jersey. Monsanto said he did find a higher than normal incidence of lung cancer among deceased employees who had worked at the PCB plant. But officials say there is no indication that the lung cancer is related or connected to PCB.
