Re:
Film No. 27530
Taken on: 10/4/68

Dear Mr. Tolin:

I am sorry to be late in answering your letter but I have been out of the country and am only now getting around to my correspondence. From the information that you have supplied to me I strongly suspect that has mitral stenosis and this accounts for the abnormal contour of his heart shadow. The fact that his heart shadow was getting larger is difficult to evaluate other than by a direct history and physical and knowledge of his past in greater detail than you can obtain. This, of course, can only be done by his personal Physician or a Consultant chosen by his personal Physician. I suspect that has more of a problem with his heart than he either knows about or is willing to talk about.

In all probability the abnormalities in the basal portions of his lung are related to the heart disease but the possibility that he may have inflammation and changes in the pleura of the lung which might be related to asbestos exposure should be kept in mind. I don't believe that at this point it should be pointed out to him.

It is my impression that you have done as much as management needs to do since you have called to his attention the fact that he has an abnormal film. From my own past experiences I would not advise making a stronger approach to either or his Physician.

With best wishes,

Sincerely yours,

George W. Wright, M.D.
Head, Medical Research

No. 25490

Reading Date 8-11-70

Interpretation of single roentgenogram of chest

taken on 7-31-70

There are interlacing linear densities in both bases giving the appearance of "Kurley B lines" and a suggestion of cyst formation. In the mid-left chest there are scattered small nodular densities. The 7th rib on the right is the site of an old fracture.

A complete occupational history is needed for adequate evaluation of this film.

FORWARD COMPLETE OCCUPATIONAL HISTORY TO DR. WRIGHT, COPY TO THIS OFFICE.

No. 35490

Reading Date 2/29/72

Interpretation of Single roentgenogram of chest

taken on 2/5/72

There are numerous irregular densities in the lower half of both lungs. The diaphragm margins are obscurred, especially on the left. These abnormal shadows have developed gradually since 1953 and would be compatible with a diagnosis of asbestosis.

The prominent right side of the cardiac shadow has persisted unchanged since 1953 and likely has no significance.

No. 25490

Reading Date 9-9-68

Interpretation of single *roentgenogram of chest*

taken on 8-28-68

There has been a gradual increase in the basal bronchovascular markings and Kerley's lines are present. The cardiac silhouette is abnormal in that the right side is bulged to the right. Does he have a non-occupational medical pulmonary or cardiac problem to account for the appearance of these films??

PLEASE ANSWER DR. WRIGHT'S QUESTION.

of chest taken on 9-16-53
compared with taken on

The bronchovascular markings are particularly prominent and extend out to the chest wall in both lower lung fields. This pattern likely has no significance and alone certainly does not warrant the suggestion of asbestosis. However, if this man is exposed to the inhalation of asbestos fibre he should be studied each year for any further evidence of asbestosis.

Re:

Dear Dr. Wright:

CHEST

The examination consisted of a six foot postero-anterior projection of the thoracic contents for lung detail.

Some degree of interstitial fibrosis is present in both lower lung fields. Emphysematous changes are present bilaterally. No active parenchymal infiltration could be seen.

The heart is normal in size and configuration; the aorta and mediastinal structures are unremarkable.

Thank you for referring

Plant: Millington, N.J.

No. 35490

Reading Date 2/29/72

Interpretation of Single roentgenogram of chest

taken on 2/5/72

There are numerous irregular densities in the lower half of both lungs. The diaphragm margins are obscurred, especially on the left. These abnormal shadows have developed gradually since 1953 and would be compatible with a diagnosis of asbestosis.

The prominent right side of the cardiac shadow has persisted unchanged since 1953 and likely has no significance.

GEORGE W. WRIGHT, M. D.
Saint Luke's Hospital
11311 Shaker Boulevard
Cleveland, Ohio 44104

KK

Name [redacted] [redacted] Plant: Millington, N.J.

No. 25490 Reading Date 8-11-70

Interpretation of single roentgenogram of chest

taken on 7-31-70

There are interlacing linear densities in both bases giving the appearance of "Kurley B lines" and a suggestion of cyst formation. In the mid-left chest there are scattered small nodular densities. The 7th rib on the right is the site of an old fracture.

A complete occupational history is needed for adequate evaluation of this film.

FORWARD COMPLETE OCCUPATIONAL HISTORY TO DR. WRIGHT, COPY TO THIS OFFICE.

F. H. ZIMMERMAN 8/14/70

Plant: Willington, New Jersey

No. 25490

Reading Date 9-9-68

Interpretation of single roentgenogram of chest

taken on 8-28-68

There has been a gradual increase in the basal bronchovascular markings and Kerley's lines are present. The cardiac silhouette is abnormal in that the right side is bulged to the right. Does he have a non-occupational medical pulmonary or cardiac problem to account for the appearance of these films??

PLEASE ANSWER DR. WRIGHT'S QUESTION.

F.H.ZIMMERMAN 9/16/68

GEORGE W. WRIGHT, M. D.
Saint Luke's Hospital
11311 Shaker Boulevard
Cleveland, Ohio 44104

KK

Name

Plant: Millington, N.J.

No. 25490

Reading Date 10-12-66

Interpretation of single roentgenogram of chest

taken on 9-22-66

Comparison of this film to those of 1964 and 1953 shows no change. The bronchovascular markings are prominent and somewhat distorted, especially at the bases.

GEORGE W. WRIGHT, M. D.
Saint Luke's Hospital
11311 Shaker Boulevard
Cleveland, Ohio 44104

KK

Name [redacted] Plant: Millington, N.J.

No. 25490 Reading Date 3/2/64

Interpretation of single roentgenogram of chest

taken on 2/6/64

The film of this date shows no change from that of 1962 or for that matter, from ~~that~~ the one of 1953. The bronchovascular markings are abnormally prominent at both bases.

GEORGE W. WRIGHT, M. D.
Saint Luke's Hospital
11311 Shaker Boulevard
Cleveland 4, Ohio

KK

Name [redacted] Plant: Millington, N.J.

No. 66-62 Reading Date: 1/22/62

Interpretation of single roentgenogram of chest

taken on 1/5/62 compared with taken on

The broncho-vascular markings are unusually prominent at both bases. Kerleys lines are seen at left base and to a slight degree on the right. The cardiac silhouette is unusual with a bulge on the right border. The question of some sort of heart disease must be raised.

Re:
National Gypsum, Millington, N.J.
Chest Xray: No. 14-60-B

Dear Dr. Wright:

A postero-anterior projection of the thoax was obtained, and our previous reports were consulted for comparison.

There is no evidence of any active pleural or parenchymal disease process. The heart is of normal size and configuration. There is noted some elevation of the left pulmonary root shadow, with fibrotic strands extending from the left hilum toward the left apex. Similar findings were described on a previous report, dated 9/19/57.

Thank you for referring to us,

Sincerely yours,

Edward G. Allen
