Because of the low number of animals involved in the referenced study (4 males and 8 females/group), and because of the need to follow clinical and reproductive observations for each animal, tissue analysis must be conducted for each animal. Each monkey in this study is costing Monsanto approximately $3,000. For that price, it seems logical to obtain as much pertinent information on each monkey as possible. Orville, please proceed, as originally stipulated, by analyzing all fat samples.

James Laveglia
