The safety review for Phase I of the Aroclor Expansion (CEA 1800) was held on June 18, 1968. The following comments were a result of this meeting.

(1) Suggestion: Investigate the possibility of improving the safety platforms around the domes on the 20 M gallon biphenyl cars.

Action: Modification of the existing safety platform would cost about $35./car and cause us operational problems. To avoid slippage on the "un-grated" portion of the dome we have applied paint with sand spread over it. This modification has proven satisfactory, and the decision has been made not to proceed with further modifications at this time.

(2) Suggestion: Investigate the possibility of insuring successful operation of the combination pressure/vacuum relief devices on the 22 M gallon aluminum Aroclor storage tanks.

Action: The vent nozzle will be inspected to insure it is not blocked, and the spring settings on the instrument will be checked in the field prior to start-up.
