Mr. A. R. Gebrin
Assistant Chief Engineer
Screw Conveyor Corporation
700 Hoffman Street
Hammond, Indiana 46320

Dear Mr. Gebrin:

In accordance with the agreement made with Mr. John C. Williamson, your Pittsburgh representative, we are sending you approximately 2000 pounds of UNIBESTOS scrap. This material is to be used to test the effectiveness of your live bottom bin and en masse conveyor in feeding the scrap to our process. The material will be shipped to you in sealed bags/cartons and should be stored in this manner until my arrival.

As you may already know, there is considerable controversy concerning the toxicity of asbestos dust and until this is either refuted or substantiated by further study, we feel obligated to advise you to avoid careless handling of the material.

We will loan you Bureau of Mines approved filter respirators for any of your employees who may be exposed to a dusty environment created by this material. You may return the material to us in the sealed containers when the test is concluded for additonal study by our process engineers and subsequent disposal.

We recommend that you remove any residual dust from equipment and building environment with your vacuum cleaners at the conclusion of the test.

Please let Mr. Williamson know the date most convenient for you to conduct the test and if any charges will be incurred. I'll be glad to furnish any further assistance you might need.

Very truly yours,

John L. Hyde
