November 17, 1958

Mr. DeWitt Huffman
Ohio Division of Safety & Hygiene
State Office Building
Columbus 15, Ohio

Dear DeWitt:

Attached is Aetna's report of February 21, 1957, covering the dust survey of the Pilot Plant at our Technical Center, Toledo.

The only dust count made at the batch operation was no. 1. This was taken in the batch house itself and not at furnace charging. Hence, it is not directly applicable to Mr. Daniells' case.

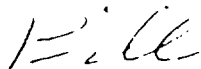

We didn't take a dust count during furnace charging because there is no dust exposure here. The batch is transported from the batch house to the furnaces in monorail buckets. A bucket is positioned over the doghouse of the furnace and allowed to "choke" feed into the furnace. There is no fall of batch through the air and hence no dust.

Samples 2 and 3 relate to a product in the developmental stage and have nothing to do with furnace operation.

We'd appreciate it if you would handle this report in confidence, since it touches on certain operations in the developmental stage and information on these, of course, is not usually given outside the Tech Center.

Let us know if we can do anything further.

Sincerely yours,

W. G. Hazard - Industrial Relations Division

M
