subject Analysis of AT&T Sample

Case 48106-3

date: June 14, 1978

from: C. P. Lichtenwalner

G. M. Wilkening:

The sample you sent to me on June 13, 1978 labelled "AT&T Sample" has been analyzed by X-ray diffraction and light microscopy. The light microscopy revealed the presence of many long thin fibers. According to the X-ray diffraction results approximately 20% of the crystalline material in the sample is calcite and 80% is chrysotile.

If you have any further questions about this analysis, please let me know.
