Confirming our conversation, the analytical results on the six reserve samples of Muriatic Acid which were checked by Scott Tucker for PCB are as follows:

Date Produced	PCB as Ar.1242
3-7-70	5 ppb.
3-14-70	3 ppb.
3-30-70	4 ppb.
4-7-70	4 ppb.
4-13-70	3 ppb.
4-23-70	2 ppb.

Average = 3.5 ppb.

At an early date, a sample prior to carbon treatment analyzed 148 ppb., a sample from a tower of nearly spent carbon was 4 ppb., and a sample from a fresh tower was 1 ppb.
