BET. ALEMANY & ARMY, SAN FRANCISCO

SF Examiner - Sept. 13, 1953 - Modern Living Section p. 4

in a laminated plastic surface in wood grains and a variety of solid colors and patterns. The boards come in various sized panels from two by three feet to four by eight feet, with three-sixteenths inch and one-eighth inch diameter holes spaced one inch on center over the panel.

To hand items to be stored there are special hooks which fit into these holes. There are an unlimited variety of these hooks to accommodate almost every kind of storage from shoes and hats to garden implements and workshop tools. Both hooks and panels are inexpensive. A two by four foot plain panel, which has a smooth finish on both sides, costs under $2.50. In plastic face finish the same size board costs about $7. The hooks cost a few cents each.

The inside of a bedroom or hall closet door can easily be converted into a handy storage wall with these panels and hooks. Just line the door with the panel and insert the hooks for the articles to be stored. There are hooks for hats, ties, shoes and other apparel.

For keeping garden tools out of the way yet handily available when needed the panels are also very suitable. You can attach them easily to a garage or carport wall. The applications are innumerable.

One word of caution, when painting the plain board use a spray or roller so that the paint will not fill up the hook holes.

For information on where these panels and hooks may be obtained call The Examiner, SUtter 1-2424, Extension 272, between 8 a. m. and 5 p. m., Monday through Friday.

How to Choose Sized Home

IN CHOOSING an exhaust fan for your home it is important that you select the right size fan for the ventilation job and the space in which it is to be used.

In order to do this the homeowner should know the terms used to rate fans. It is often misleading to judge a fan's capacity on its fan wheel diameter alone. The most accurate measure of a fan's capacity, once it is installed in the home, is its CFM rating. This rating states the number of cubic feet of air per minute that the fan can move.

To decide what CFM rating is needed depends upon the purpose the fan is intended to serve—in other words, the number of complete air changes per minute that will be required to do the job.

For kitchen ventilation, fan manufacturers and ventilation experts recommend an air change every two or three minutes. Bathrooms ventilated by a fan should have an air change once every two to five minutes, with the faster change of two minutes recommended for the smaller bathroom.

In basements, an air change once every five to ten minutes is considered sufficient. When an attic or a window fan is
