Observations on Draft Paper

P.1. -- ? Lynch, Smith reported their first cases in 1935 American Journal of Cancer 24, 56, 1935.

P.2. Definition of Scheduled areas -- are those in which the following processes are carried out: -- crushing, desintegrating, opening and grinding of asbestos; all processes in asbestos textile; mattress making; sawing, grinding, turning or abrading of asbestos products in the dry state; the cleaning of chambers or partitions for the collection of asbestos dust.

Regulations of 1931 require that machinery used for processes in the manufacture of asbestos giving rise to dust, be so constructed and maintained that dust cannot escape otherwise than by mechanical exhaust draught which prevents the escape of dust into the air of the workroom.

This is a counsel of perfection which in fact is not attained. There are no permitted dust concentrations but the Factory Inspector carefully inspects the [illegible] & other devices used in the industry and judged their effectiveness. He is also made aware of any fatalities and goes into particulars. There is no doubt that the dust produced is vastly less in recent years than prior to 1932.

p.6. If the autopsy details Table 2 go in, the sentence in brackets can come out as this point is already made.

I am in agreement with the spirit of the sentence on p.6 re the present position and would suggest -- has led to a considerable fall in the incidence of asbestosis & will result in its eventual supression. It is, therefore, reasonable .....

p.7 Suggest omission of last 1/2 sentence in brackets, or to echo the last sentence prior to the summary & say -- Future studies will determine whether the risk of lung cancer has been eliminated as an industrial hazard.

Pathological reports on carcinoma lung cases:

by the late Dr. J.S. Pooley	(Rochdale)	1, 2, 3
Professor M.J. Stewart	(Leeds)	9, 10, 12, 16
the late Dr. C.E. Jenkins	(Manchester)	4, 6, 11
Dr. James Dawson	(Manchester)	13, 14, 15, 17
Dr. C.H. Adderley	(Oldham)	5, 7, 8, 18

Observations on Draft Paper 31/1/34

P. 1. — ? Lynch & Smith reported their first cases in 1935 American Journal of Cancer 24, 56, 1935.

P. 2. Definition of Scheduled areas are those in which the following processes are carried out:— Crushing, disintegrating, opening and grinding of asbestos; all processes in asbestos textile; mattress making; sawing, grinding, turning or abrading of asbestos products in the dry state; the cleaning of chambers or fixtures for the collection of asbestos dust.

Regulations of 1931 require that machinery, used for processes in the manufacture of asbestos giving rise to dust, be so constructed and maintained that dust cannot escape otherwise than by mechanical exhaust draught which prevents the escape of dust into the air of the workroom.

This is a ~~counsel of~~ counsel of perfection which in fact is not attained. There are no permitted dust concentrations but the Factory Inspector carefully inspects the exhaust & other devices used in the industry and judges their effectiveness. He is also made aware of any fatalities and goes into particulars. There is no doubt that the dust produced is vastly less in recent years than prior to 1932.

P. 6. If the autopsy details Table 2 go in, the sentence in brackets can come out as this point is already made.

I am in agreement with the spirit of the sentence on P. 6 re the present position and would suggest — has led to a considerable fall in the incidence of asbestos & will ~~lead~~ result in its eventual suppression. It is, therefore, reasonable .....
