SUBJECT : Summary of Delaware River Groundwater Meeting 3/3/83

REFERENCE :

TO : Distribution

Current Situation

- plant has a plantwide groundwater monitoring program, with special emphasis on NW corner. Program was reviewed with State and a commitment made to share the data with them.

- plant pumps 1000 GPM from lower, artesian aquifer that creates a cone of depression and prevents any contamination in this aquifer from migrating off-site. All samples from this aquifer have been clean, except very recent samples from 4D that must be confirmed.

- the upper, groundwater aquifer flows toward the river. Samples from this aquifer have been clean, except for wells around the old disposal sites in N.W. corner - and area of ~5½ acres.

Shortterm Plans

- test well 4D for leakage.

- if test is inconclusive, proceed with plan to pump, or replace, well 4D.

- inform State.

- continue program to define extent of contamination, migration off-site, and possible remedial plans.

Following the meeting, a Task Force was formed to manage the total N.W. corner situation.
